

MannMitra

A GenAI mental-wellness companion for India's exam aspirants

"We obsess over students' marks, but no one tracks the thing that quietly breaks them, their mental health. MannMitra is the friend for their mind that's always awake at 2 AM when the panic hits."

The Problem

Millions of aspirants face severe stress, burnout, and self-doubt, often in silence. Generic mood trackers just ask "rate your day 1–5" and miss the **why**. Students can't always name what's wrong, and there's no one to talk to at the moment it matters most.

The Solution

A GenAI companion built around three things students actually need:

- **It reads between the lines.** Students journal freely; the AI surfaces the *hidden* stress triggers and emotional patterns they can't see themselves, not just "you seem stressed," but "you're tying your self-worth to mock scores."
- **It responds with care, instantly.** Personalized coping strategies, an adaptive mindfulness exercise matched to their mood, genuine encouragement, and an always-on companion chat.
- **It tracks the journey.** A wellness-trend view makes emotional patterns, and progress, visible over time.

Why We Win

Safety is engineered

Crisis detection runs in **code**, **not the AI**. Every entry is scanned for self-harm signals and surfaces verified India helplines (Tele-MANAS 14416). We never gamble a life on a model's mood.

It never fails a student

If the AI or network is down, a built-in offline engine still returns a real, useful reflection. Zero dead ends.

Trustworthy by design

Deterministic wellness score, server-side API keys, validated input, sanitized output, and a database locked down with row-level security.

 **How the safety works (if asked):** Crisis detection uses **no AI and no ML library**, it's deterministic pattern-matching with Python's built-in `re` (regex) module, scanning every message for known self-harm phrases. An LLM can hallucinate or miss; a regex match is 100% reliable, instant, free, and works offline. So **safety = code, empathy = AI**.

Proof It's Real

Live and deployed on **Vercel** with AI (OpenRouter/Claude) and **Supabase** persistence. Backed by **35 automated tests**, hardened with **security headers**, **accessible** (ARIA, keyboard, reduced-motion), and a calming warm UI designed to lower anxiety, not add to it.

The close: MannMitra doesn't replace a therapist. It's the empathetic companion that sits with a student through the hardest year of their life, and quietly makes sure that if they're ever in real danger, the right help is one tap away. **That's the difference between an app and a lifeline.**
